HOARE LOGIC

Assgnment Rule example

where
$$\lambda(h,v)$$
. $\nu(x)=0 \wedge \nu(y)=1$ $\lambda(h,v)$. $\nu(x)=1 \wedge \nu(y)=1$ $\lambda(h,v)$. $\nu(x)=1 \wedge \nu(y)=1$

- Is this correct? Not quite. Doesn't say anything about. + they must be the same.
 - Should also generalize to arbitrary Precondition.

> we don't cave about the details.

L λ(h,v). ∃v!. v=v'[x +> (e)(h,v')] Λ Phv'}

while rule

while b do C Consider b evaluates to false

LP3 while b do c { 25.7[b]@AP(s)}

This is true when the loop terminates. But what about the body

(As. P(s) A [b](s)} C < P}

LPJuhile b do c L 20.7[6](3) A P (5)}

we will use a more general encoding

4s.P(s)⇒I(s) {As.I(s) A [b](s)} c ≺I}

⟨PY ⟨I] while b do c ⟨ >S. I(s) ∧ ¬[b](s)}

" Induction hypothesis" for the loop.

+ Induction hypothesis must be Rouided explicitly
